

A Guide to Fabric-Formed Concrete

Editor's Note: With this Guide to Fabric-Formed Concrete it is hoped that existing and new techniques that may come along can be documented here for the benefit of others who wish to use this truly unique method of forming concrete for their projects. The Table of Contents shown below contain topics similar to ACI's SP-4 *Formwork for Concrete* as it is assumed there will be many similar considerations for Fabric-Formed Concrete as well. Topics that may not be applicable can be marked with a question mark, "?". Pages have been created for each **CHAPTER** of this document and may accessed by clicking on the hyper-link, **blue text**. Headlines have also been created for each chapter topic. Within these headline topics content may be added by selecting the "**edit**" link on the right-hand margin. Or, by selecting the "edit tab" at the top of the page, the entire page may be worked on. Where appropriate hyper-links may be added to connect topics on different pages (Chapters). Just use the Internal Link button in the Editorial Toolbar when in edit mode. This is an evolving work where topics and pages can be added or deleted as required. *You must be registered and logged in to add or edit content.*

TABLE

<align left> [INTRODUCTION](#)
General Objectives in Fabric-formed Building
How fabric formwork affects concrete quality
Causes of failures
Planning for Safety
Relationship of architect, engineer and contractor
Measurement and payment for formwork
How the architect-engineer can reduce form costs
[OVERALL PLANNING](#)
Development of a basic system
Key areas of cost reduction
Planning for maximum reuse
Economical form construction
Setting and stripping
Other costs affected by formwork plan
Planning examples
[MATERIALS, ACCESSORIES, PROPRIETARY PRODUCTS](#)
Fabric
Lumber
Engineered wood products
Plywood
Other framing and facing materials
Insulation and insulating forms
Hardware and fasteners
Prefabricated forms
Shoring and scaffolding
[LOADS AND PRESSURES](#)
Vertical loads
Lateral pressure of fresh concrete
Lateral loads
Other loads
[FORM DESIGN](#)
Notation
Basic Simplifications
Beam formulas
Design criteria
Bearing examples
Wall, slab and beam form design
Form accessories
Column form design
Shoring and scaffolding
Bracing for lateral loads
Camber and adjustment for settlement
